Debrarian 3 is a complex and dangerous tool that can be used to fix a bad or bad sectors in hard drives. A bad sector can lead to corrupted data, damaged files and system crashes. Debrarian 3 will not only fix a bad sector, it will also write a new boot sector to the bad sector. Debrarian 3 can be run on a LiveCD. Debrarian 3 runs in RAM so it will not use disk access to determine which files are infected. It is a very clever tool with a high level of efficiency, but be warned - It is considered in the top four most dangerous software in the world. You may download it at: semiconductor integrated circuit (IC) industry has experienced rapid growth. In the course of IC evolution, functional density (i.e., the number of interconnected devices per chip area) has generally increased while geometry size (i.e., the smallest component (or line) that can be created using a fabrication process) has decreased. This scaling down process generally provides benefits by increasing production efficiency and lowering associated costs. Such scaling down has also increased the complexity of processing and manufacturing ICs and, for these advances to be realized, similar developments in IC manufacturing are needed. For example, as semiconductor devices, such as a metal-oxide-semiconductor field-effect transistor (MOSFET), are scaled down through various technology nodes, strained source/drain features (e.g., stressor regions) have been implemented to improve transistor performance. Although existing techniques for forming stressor regions have been generally adequate for their intended purposes, as device scaling down continues, they have not been entirely satisfactory in all respects. Deepithelialized retrosigmoid approach for cerebellopontine angle lesions. Exposure of intracranial lesions in the cerebellopontine angle (CPA) requires drilling of the porus acousticus to create an adequate plane of entry. Because this technique provides a limited exposure, alternative surgical routes that may offer additional exposure have been devised. Here we examine the deepithelialized retrosigmoid approach (RSA) as a means of obtaining a wide exposure of the CPA. Between November 2000 and April 2002, 28 patients underwent surgery using
